

Leo May 25-May 31

1. Rerun the embedding on new data (n=19):

Loadings of subjects after joint embedding:

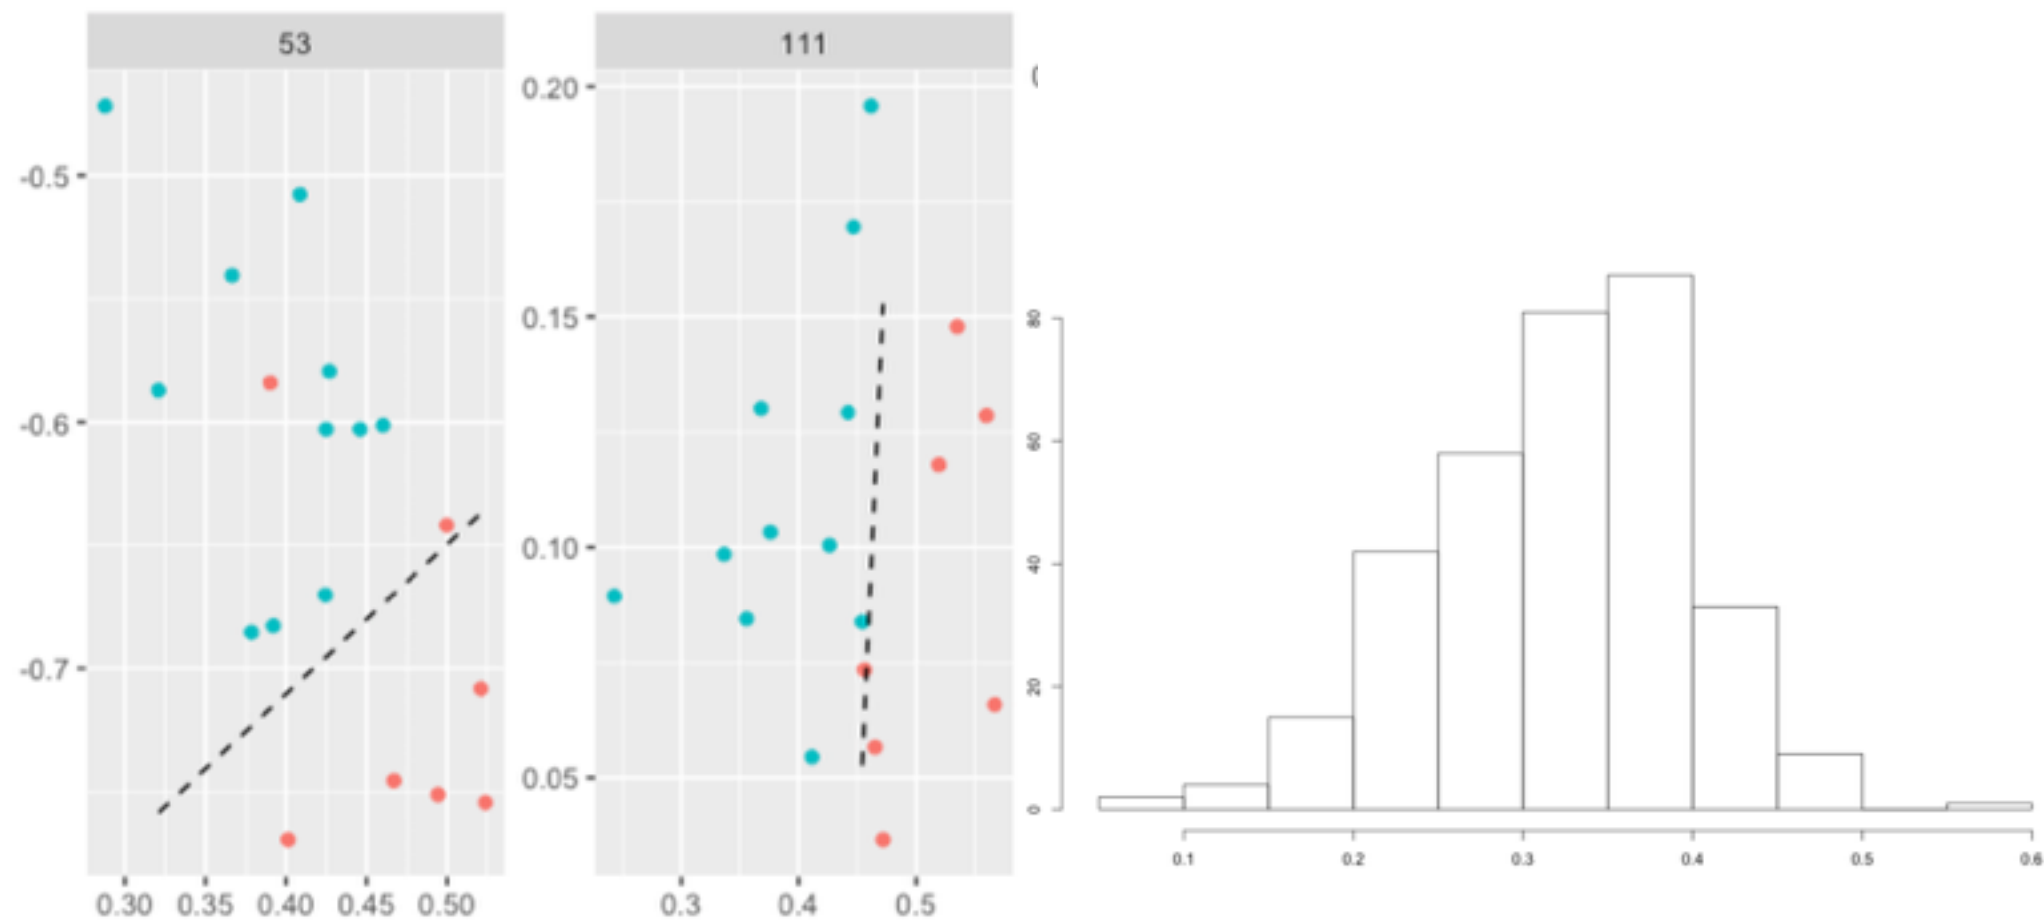

It seems only the first dimension has some difference between 2 groups.

Omni-embedding:

Two vertices with the lowest LDA errors
(0.055)

List of regions to Test

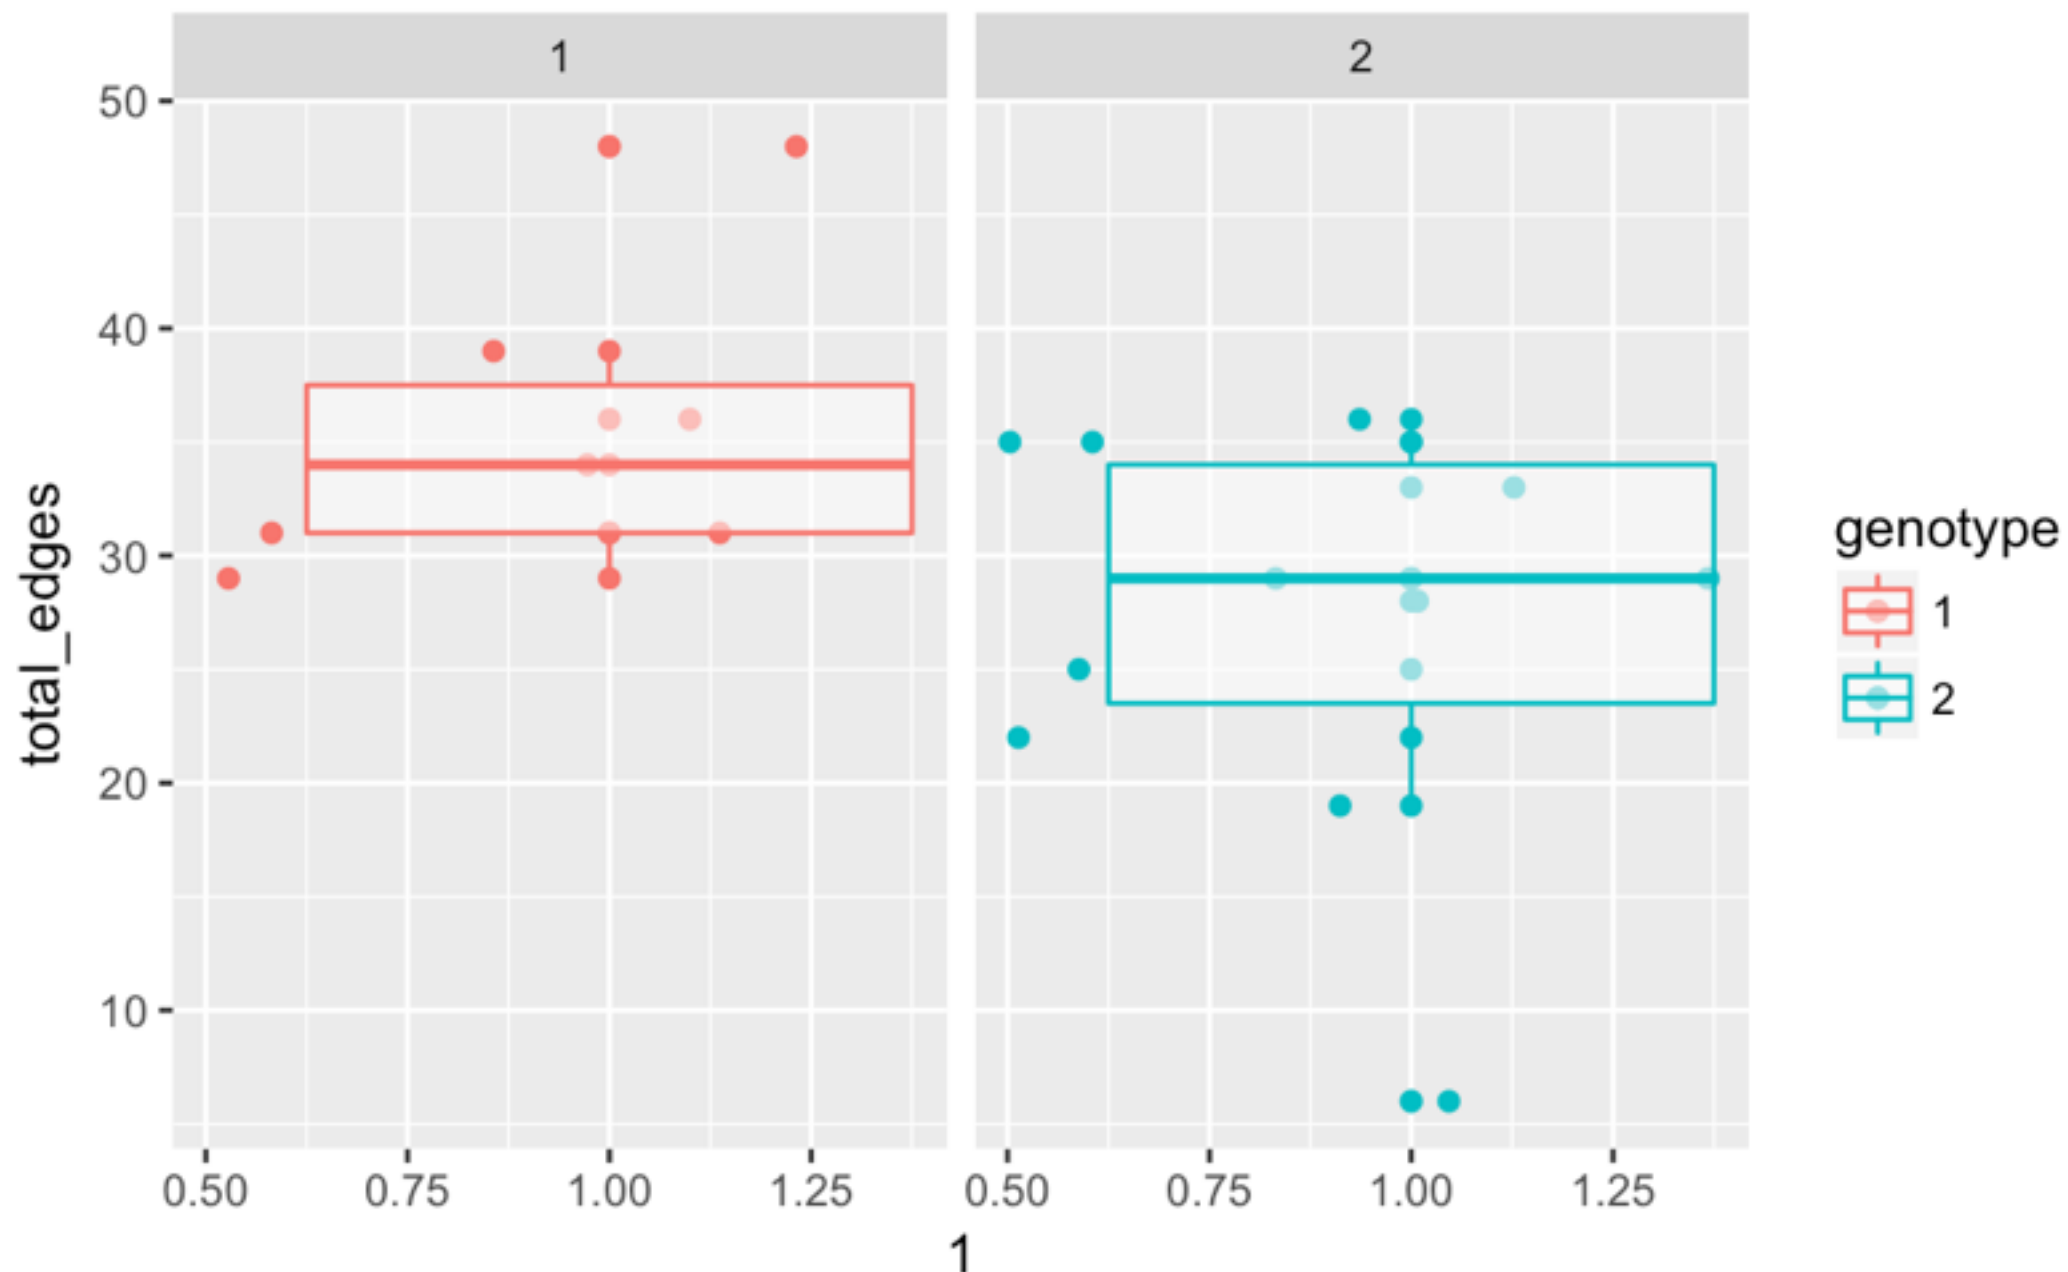

1. fimbria-fornix 121 123
2. thalamic nuclei 74 158
3. septum 63
hippocampus 52
hypothalamus circuit 60 62 164 166
4. cerebellum 92 93 94 95 96

Method:

- Count the edges among the ROIs in selected region & selected hemispheres, box-plot and Wilcoxon rank test.
- For each region, we can edges in 4 different ways: within full brain, L hemisphere, R hemisphere and across-L-R.
- Only the one with significant result is reported.

#Total connectivities in all 4 regions

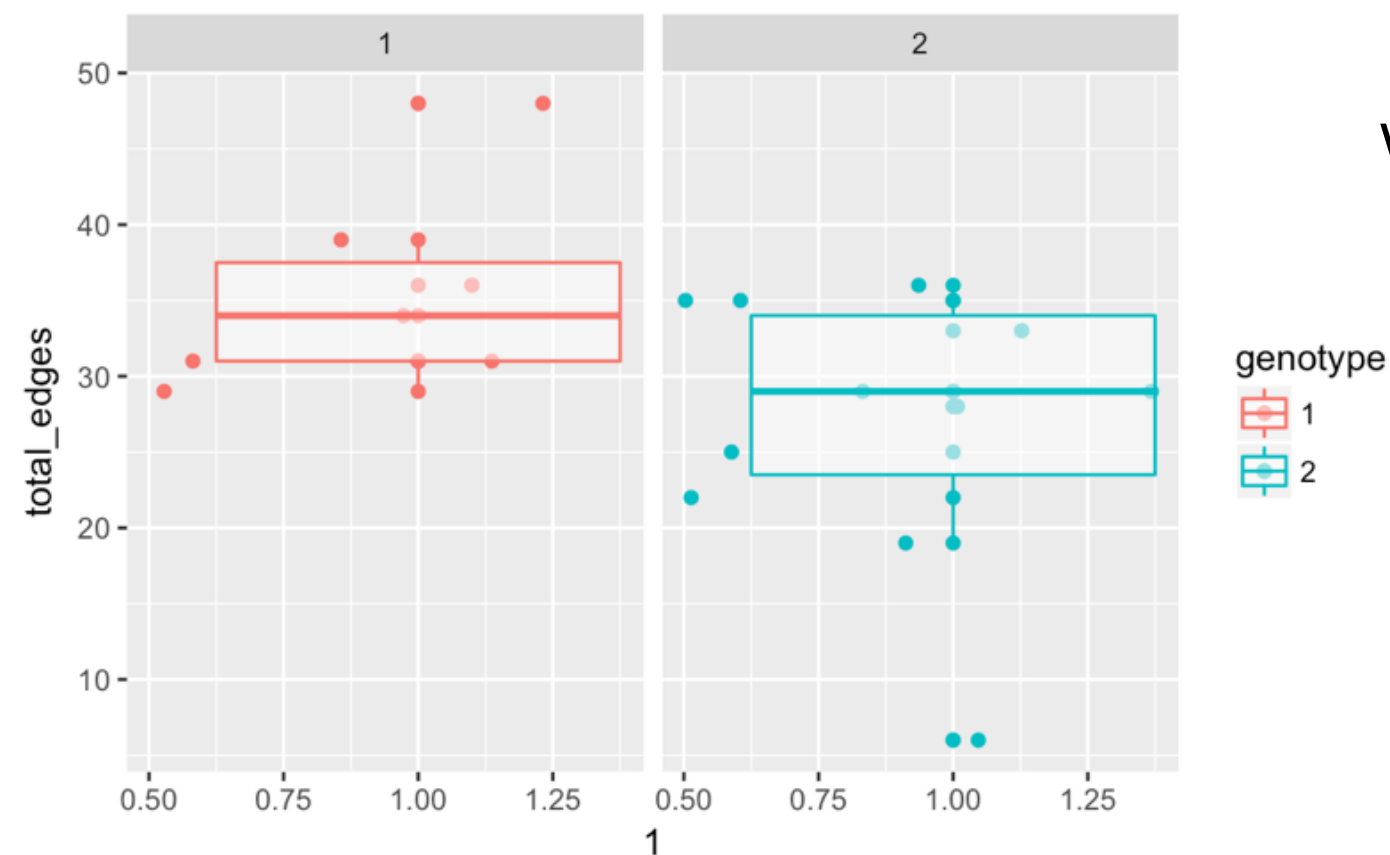

- across-L-R p-value = 0.05067

region 3:

septum + hippocampus
+ hypothalamus circuit

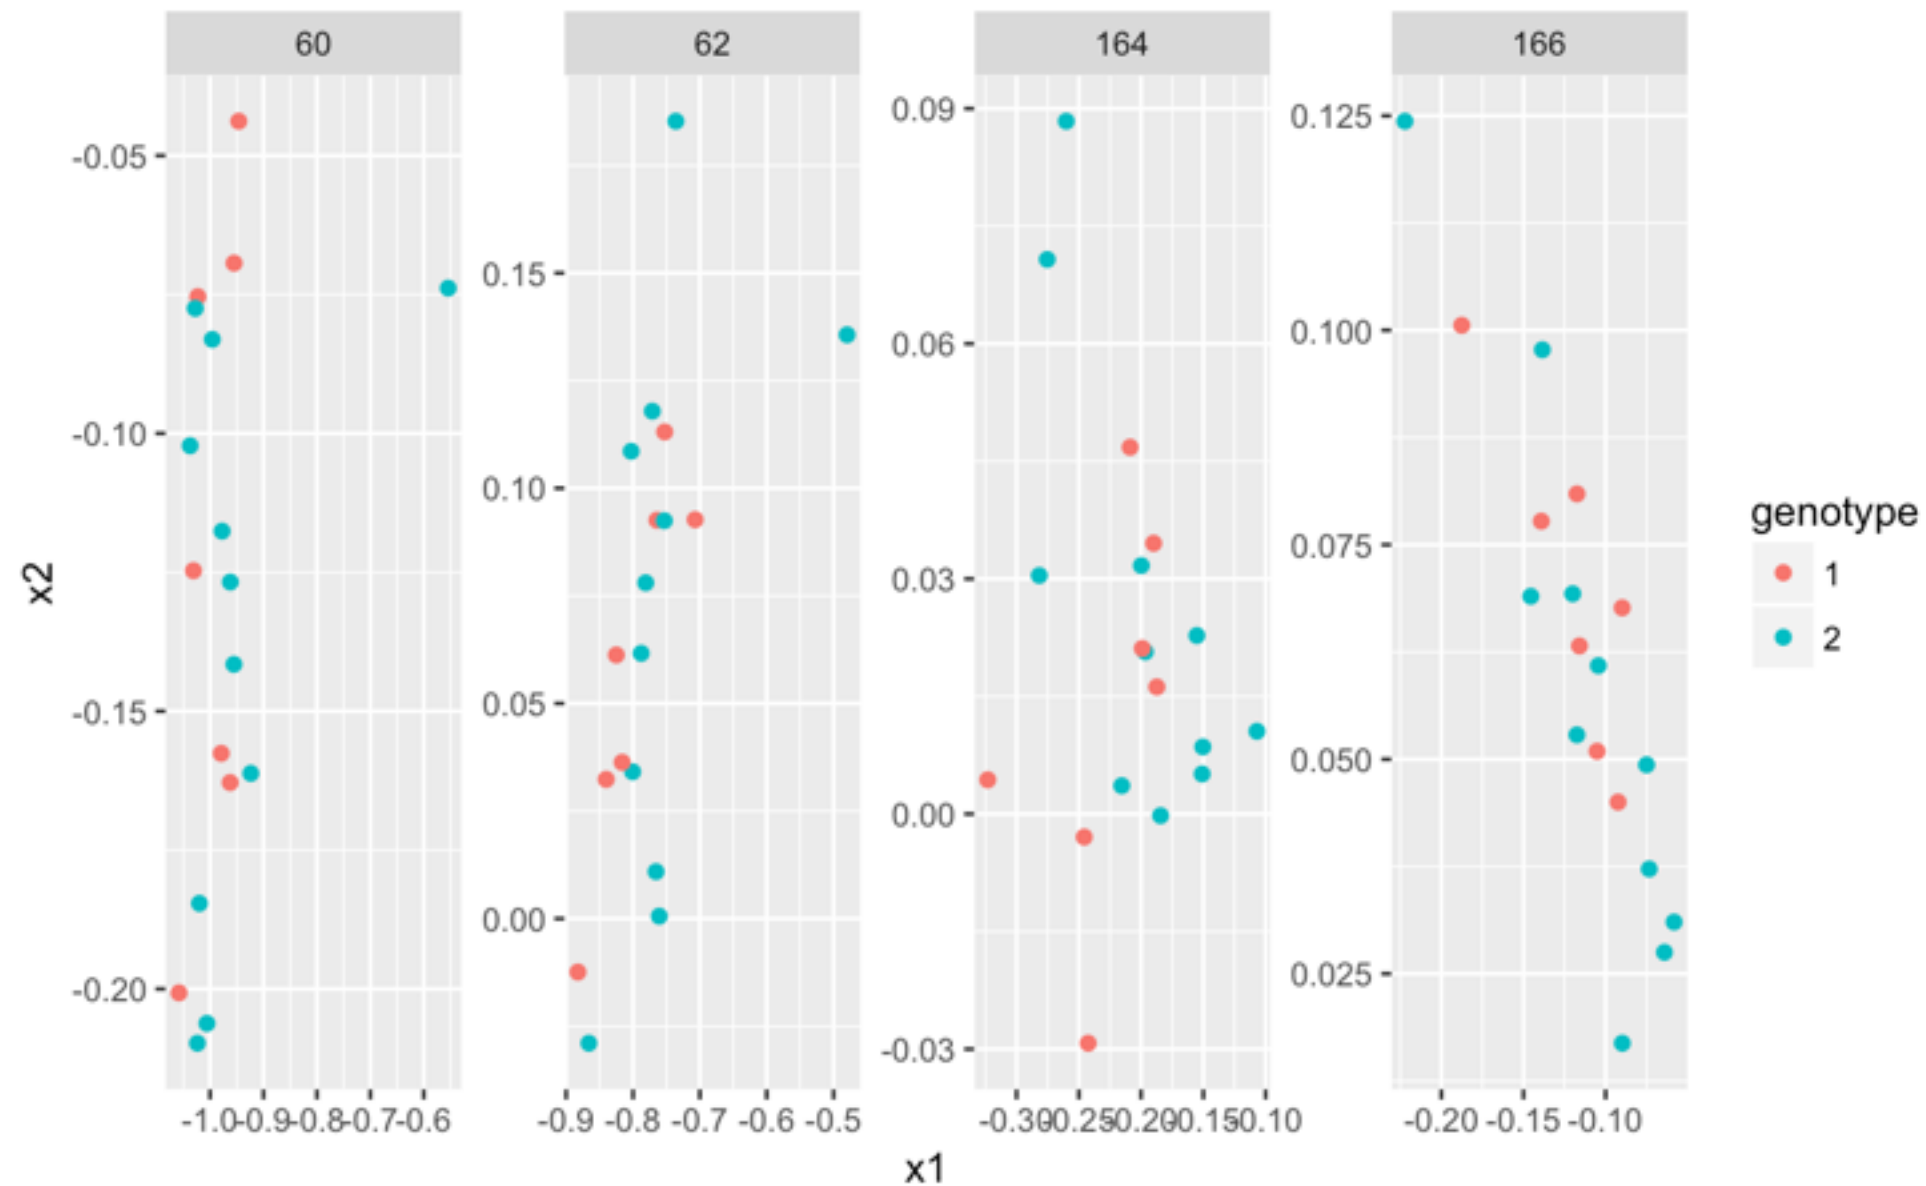

1. no signals in:
 - all 3 combined
 - septum and hippocampus
2. hypothalamus circuit

whole brain

p-value =
0.04816

omni-embedding of hypothalamus circuit

LDA error: 0.44 0.33 0.333 0.388

Next week:

Discuss about the next step to dig deeper on hypothalamus.

Spatial coordinate assisted embedding?
